Database explanation

Users

Links the account ID to the username and password. The password information must be encrypted. Bcrypt is the strong candidate with 15 rounds of salt.

Leaderboard

Intermediary table between users and runs.

Runs

The table with the relevant data has an ID, the total money made (all the money won), money spent, and earnings, which is the difference between the other two. It's linked to a metadata table to attach more nonessential information, such as how the run was ended (if already terminated). It has a special property called isRunning. If it is null, that means it has ended. It would store the ID for a running table.

Metadata

Later can be extended if needed, but for now it stores the level of the player and if it won, lost, or is playing.

Running

The table saves the session ID if it is a cache hit. If not, a new instance of the game must be rebuilt. The instance will be built from the other column (data) that stores a JSON file.

Exploits Used

Intermediary table to retrieve all the exploits used in some run.

Exploits Data

Metadata for each table, can have the name, price, type (low, high, or critical), and the description.
